

**SPECIAL**

- The orbital mine moves 10 cm towards the nearest enemy ship in each ordnance phase.
- If it moves into contact with the base of an enemy ship it detonates and rolls eight dice to hit the target vessel. The target vessel may fire its turrets normally. If the mine is hit it rolls four Attack dice instead of eight. Shields protect against hits from mines normally.
- An orbital mine is treated like any other ordnance for the purposes of movement, Blast markers and shooting. Except for fighters, mines are not affected by, and do not affect, any other Ordnance markers they come into contact with. If the mine comes into contact with fighters, both markers are removed as normal. Friendly attack craft (including fighters) will not attack activated mines.
- Once mines are in play, they are always active until destroyed. This includes individual mines purchased separately, from a minefield, as well as mines launched from modified carriers.
- Individual mines purchased separately count for victory points when destroyed, regardless of how they are removed from play.

An orbital mine is a piece of heavy ordnance placed to protect a location such as a planet, moon or space station. With its own small engine it will home in on any energy signature it detects which is not accompanied by a friendly beacon signal. At close range it detonates a powerful warhead, which can cripple even the largest vessel.
